2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

- As concerns about climate change grow, green growth in the form of low-carbon economy (LCE) has been an effective policy as an alternative in the transition from fossil fuels since global warming has become a critical issue facing the planet.

Korean government officials say green growth is more than just a concept to tackle climate change. They say it involves a fundamental shift in the growth paradigm—from the current one oriented toward quantitative growth and based on the massive consumption of fossil fuels, to one prioritizing quality of life and founded on a virtuous cycle of economy growth and environmental protection.

In 2009, the Korean government unveiled the 5-year Green Growth Plan, a medium-term plan for implementing the green growth strategy. The development of low-carbon green city was a key area.

In order to combat climate change and to adapt national vision for low-carbon green growth, Korean government designated some municipalities as low-carbon green cities. With the Ministry of Environment, Korea, the Green Growth Committee implemented demonstration projects in these municipalities. Gangneung city, a city located east of Seoul, made the “model & vision for low-carbon green city” and took a leadership role in embodying a green society.

President Lee Myung Park has remarked in the Forum for Development of Gangwon Area on February 10, 2009 that “we need to develop the low-carbon and green city in Gangwon province and promote the city as the global premium city, setting an example for low-carbon and green growth. Korean government has launched the service for development planning of the pilot city on March 31, 2010.

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

- The Gangneung low-carbon green city strategies for green growth made several political implications for low-carbon economy:
 1. It was expected that production and additional values triple the budget of green city development.
 2. The program was expected to create over 5,000 jobs by 2013.
 3. The program was expected to stimulate the local economy by increasing the number of tourists by about 6.7% (920,000) and generating tourism revenues of KRW 85 billion.
 4. The program would significantly reduce green house gas emission by recovering lakes and improving the green transportation system.
 5. The programs had developed the model to save energy and respond to climate change by promoting of bicycles and distributing green homes.
 6. The program has been utilized as channels for education, promotion and experience for the public.
 7. The program has served as the testbed to create new growth engines and build the foundation for overseas market entries.

One of key components of low carbon economy is to drive city competitiveness. Cities clearly see addressing city climate change as a way to drive growth and competitive advantage in their jurisdictions. Addressing climate change and green smart urban development will lead to development of new business industries in cities.

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

- Considering increasing attention put on urban-related issues, cities are in the age of low carbon green growth. These are effective ways to both decrease our carbon footprint and adapt to climate change through urban planning techniques that incorporate energy conservation, use of renewable energy, ecological restoration, green transportation and buildings.

As an example, Suwon City, Korea, is a member of the EcoMobility Alliance and has achieved excellent results in certain dimensions of sustainable mobility. The city has adopted an eco-mobile lifestyle to experience how EcoMobility can influence lives of residents in a neighborhood in Suwon. Local Agenda 21 Movement is very strong in Korea with the slogan "Think globally, act locally". The Korea Climate and Environment Network plays a main role in promoting the Movement in Korea. Virtually all local governments in Korea have adopted their Local Agenda 21 plans and have secretariats for the implementation of their plans with active participation from 9 stakeholder groups which were identified by UNCED. The Korea Climate and Environment Network took over the job of the Korea Green Star Network which was responsible for the Local Agenda 21 activities.

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

- The Ministry of Environment has launched Eco-City initiative according to the 2012 UN Earth Summit for Sustainable Development Rio+20. Korea is one of countries to create UN sustainable cities, "Agenda 21 Eco-Cities". Urban eco-cities claim to regulate climate change, food distribution, water securitization, culture and support in ways that are not facilitated by the current living conditions.

In April 2012, Seoul Metropolitan Government (SMG) has launched a program with the slogan "One Less Nuclear Power Plant", to reduce the city's use of energy by 2 million tons of oil equivalent, equal to the annual output of a nuclear power plant, and to reduce its environmental impact accordingly. The citizens of Seoul were inspired. They achieved their target in June 2014, six months ahead of schedule. Now SMG has launched phase 2 of the program, confident that the citizens of Seoul can do even better. Their crucial aspect of phase 1 was its success in enlisting active participation from the citizens of Seoul, individuality and in their many affiliations.

Carbon Banking System is a voluntary GHG reduction campaign in the manner of governance approach to climate change at the household level. The Gwangju City's carbon banking system is a carbon finance system which has implemented in 2008 as the first of its kind in Korea to reduce GHG emissions per capita. Because Gwangju's household and commercial levels accounted for 39% of GHG emissions in the city, reductions at the household level were urgently needed. Gwangju signed an agreement as a pilot study for climate change response (10 April, 2008), and planned activities around a carbon banking system to draw citizens' attention on the plan to reduce GHG emissions by 10%. Gwangju Bank issued a "Green Card", loaded with "Carbon Points" to individuals who reduce energy consumption compared to past usage.

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

- The card operates like a debit or credit card, providing card usage fees to the bank. For the consumers, the carbon points are redeemable for a wide range of green goods, public transportation and discounts at public sector facilities. The carbon banking system in Gwangju has led to a reduction of nearly 85,000 tons of CO₂ from 2008-2012 and projects an estimated 983,188 tons of CO₂ emission reduction by 2020.

The latest approach in developing a low carbon economy in Korea is to establish Jeju Island as a zero carbon island by 2030. On 1 July, 2006, Jeju Island received provincial status. After the establishment of the governing institutions, economic and other reforms had been carried out including environmental protection laws. In June 2012, Jeju Province and the Korean central government jointly announced the plan to establish the "2030 zero carbon Jeju Island", aiming at being carbon-free by 2030 and achieving a sustainable development through the only use of renewable energy.

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

On the 21st Conference of the Parties to the United Nations Framework Convention on Climate Change in December 2015, Korea's President Park delivered a speech reaffirming the 2030 plans for Jeju Island being transformed "into a carbon free island by replacing its entire fleet of cars with electric vehicles and meeting 100 percent of its energy needs through renewable energy sources". As for power generation, the envisaged program has three phases:

- In the first phase, a "zero-carbon island demonstration model" will be built. On-shore, seven wind energy pilot areas are being established with expected power generating capacity of 143MW. Three off-shore wind power generation test areas will be established with a total power generation capacity of 398MW (Fig. 8).
- In the second phase of the plan, by 2020, a "zero carbon island" infrastructure shall be established with the use of smart grids for renewable energy transmission. According to the plans, Jeju renewable energy generation shall account for more than 68% of total primary energy supply by 2020.
- In the third stage, up to 2030, Jeju Island will entirely use on-shore and off-shore wind power, solar energy and energy storage systems (ESS) to replace all fossil primary energy. The ultimate goal of the Jeju government is to install 2.35GW wind power (350MW of on-shore and 2GW of offshore).

It is planned to even produce 20% more electricity than needed on the island and feed in the surplus energy into the national grid in order to compensate for remaining fossil fuels used in other sectors of the economy and to become a true "zero-carbon island".

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

- Very recently, Korean government has announced that new public buildings should be zero-energy buildings from 2020 according to "The 2030 National GHG Reduction Basic Roadmap".

On Tuesday (6 December, 2016), the Korean government announced mid and long-term action plans to reduce greenhouse gas emissions in the country.

The pan-governmental comprehensive framework, approved by the cabinet, is intending to achieve the country's goal of cutting carbon emissions by 37 per cent, or 315 million metric tonnes, as set out by the Paris Agreement.

In the new plan, the government seeks to boost incentives for renewable energy and cleaner power projects, in the hope of raising the share of renewables to 7 per cent by 2020.

They also plan to introduce a cap-and-trade system to expedite industry innovation and environmentally friendly investment, while helping to integrate in to the future global carbon market.

The plans also pledge to expand funding in the development of climate technologies such as solar and fuel cells and conversion of waste gas, as well as doubling investment in clean energy research to 1.12 trillion won (\$957 million) by 2020.

According to the International Energy Agency, Korea is the world's seventh-largest polluter, with its carbon output reaching 572 million metric tonnes in 2013.

Under the plan, the government aims to slash 219 million metric tonnes, or nearly 70 per cent of the total reduction goal, from eight different areas including power production, industry and buildings.

2. Selected Approaches to the Green Urban Development and Low-Carbon Economy at the City Level in Korea

The largest reductions would come from electricity generation with 64.5 million metric tonnes, followed by industry with 56.4 million metric tonnes, buildings with 35.8 million metric tonnes and new energy sectors including electric vehicles and energy storage with 282 million metric tonnes. Seoul also looks to curb 96 million metric tonnes through international market mechanisms, focusing on carbon credit trading and funding sources.

Upon the release of the plans, the government said: "The action plans were formulated in a way that helps to shift the reduction-focused responses to climate change to a fresh paradigm centering on the market and technology ... and strengthen the private sector's role and promote the acceptability of the policy." The government ended the report by leaving room for future revisions, saying plans would be adjusted according to changing economic condition (Climate Action, December 2016).

3.1 Summary of City Example at the Strategic Level

Model of Goyang City and Ministry of Science, ICT and Future Planning, Korea

This is a bold, new initiative. In order to provide a tested model for creating a sustainable IoT-integrated smart city, Goyang city will implement well established urban IoT service package program.

This program aims to solve problems commonly faced by cities through the strategic use of open smart city platform.

Goyang Smart City will be created under the Smart City Project supported by the Ministry of Science, ICT and Future Planning of Korea, through the consortium of six companies and institutes between the public sector (Goyang city and Goyang Knowledge and Information Industry Promotion Institute), private sector (LG U+), and research institutes. Based on the four themes "City of Smartness", "City of Safety", "Environment City" and "Energy Saving City", the city will be developed as an IoT-integrated City, which will be a smart solution provider.

Goyang city agreed to establish "Happy hope city" as a smart city supporting IoT solutions in May 2016 and was selected by the government in June 2016.

The city will foster the Korean Silicon Valley (Goyang Techno-Valley) and has hosted the Smart Cities Innovation Summit Asia, for the first time in Korea, in September 2016.

3. Eco - Smart City Movement in Korea

3.1 Summary of City Example at the Strategic Level

Model of Other Smart City Projects in Korea

The achievements and milestone of smart cities promoted by Korean cities include:

Seoul

- Hosted Seoul Digital Summit with more than 150 association and enterprise to discuss exporting K-smart city model.
- Awarded at “world smartcity award in Barcelona”

Daegu

- Established IoT testbed with Samsung and SK
- Fostering Automatic water reading system and water leak

Busan

- Will establish global smart city in Haeundae region till 2018
- Invested \$2.5 trillion dollars to build U-city in Busan
- Agreed to cooperate in forging smart city together with Barcelona, Spain

Paju

- Executing Smart water service
- Controls water purity through ICT technology

Incheon

- Applied smart service starting from 2008 in Songdo.
- Exported Smart service of Incheon in Ecuador in 2013
- Cooperating with Thailand about Incheon’s smart city business

Gimpo

- ‘Smartopia Gimpo’ project being executed since 2014
- Will construct future city converged with ICT solutions such as security, Smart home, Smart transportation, life style, green service, Smart welfare etc

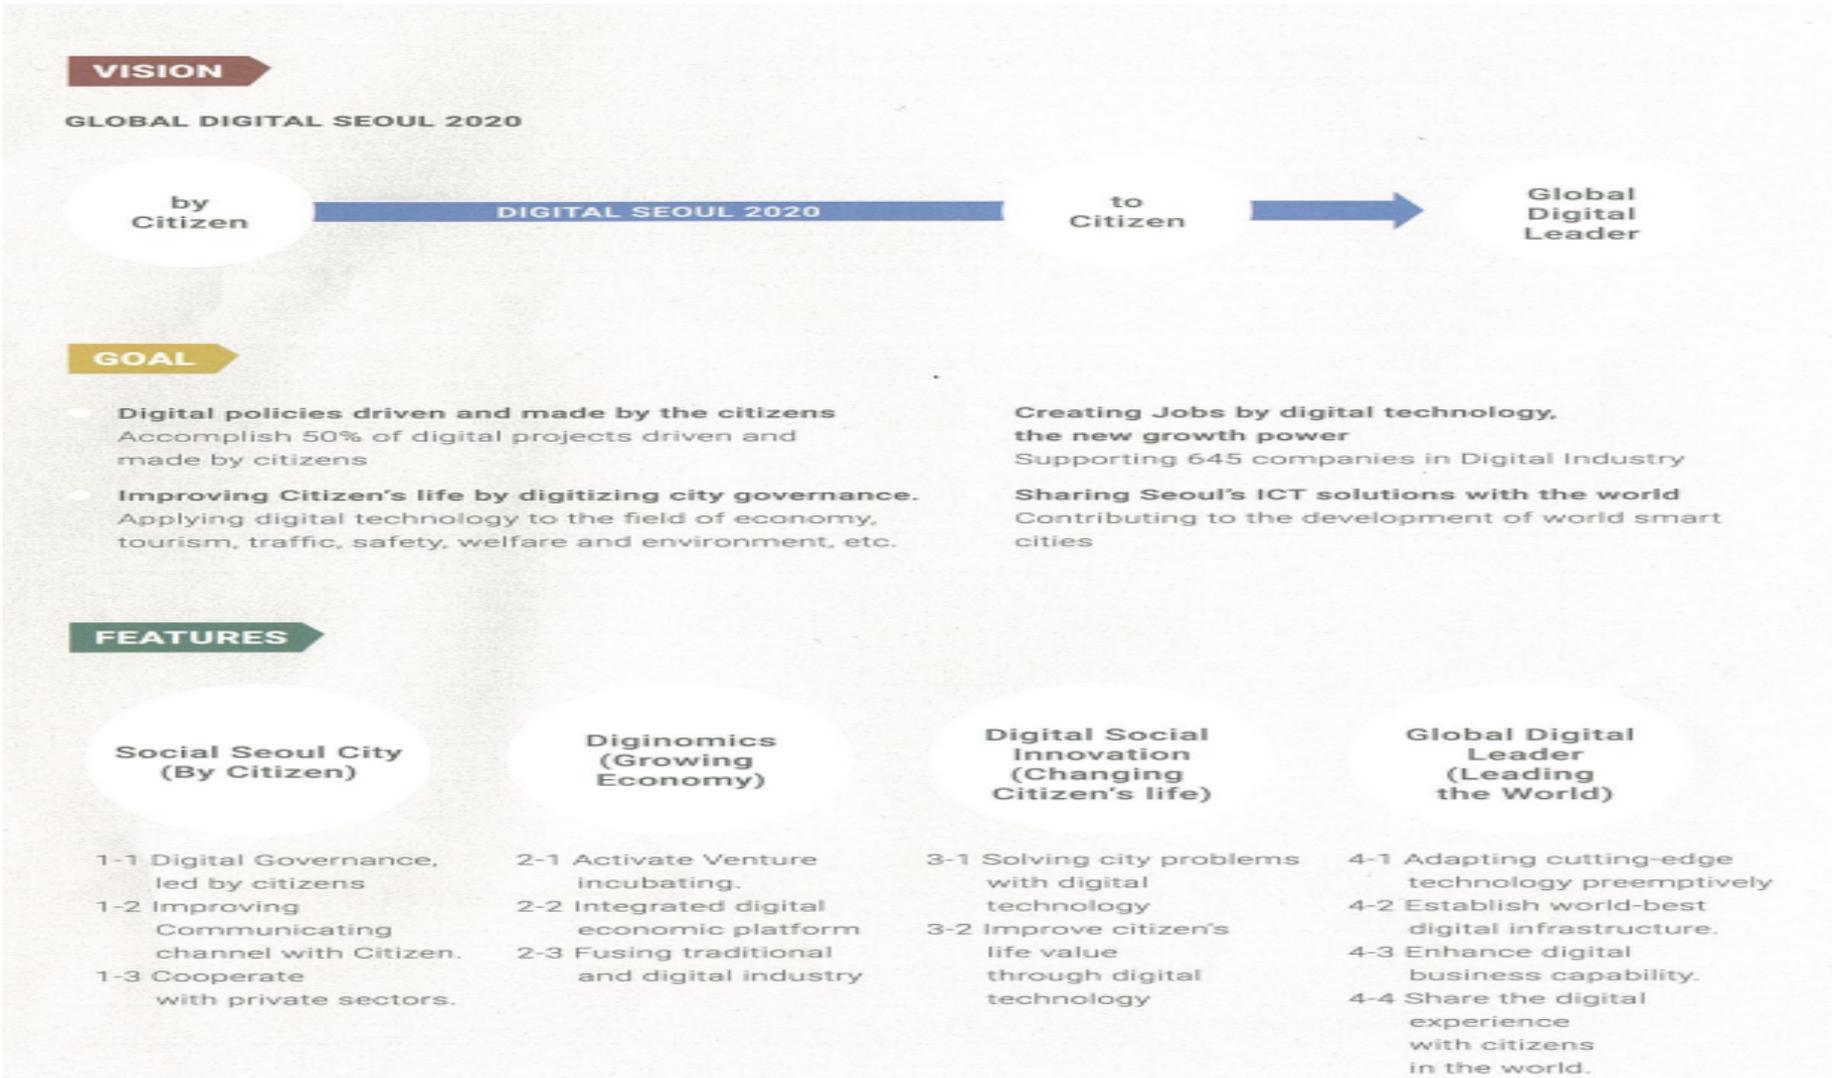

In a recent seminar on climate change preparation projects (CCPP) utilizing the GCF in Korea, climate change business models have been suggested as follows:

Project for combining new and renewable energy and energy storage system (ESS)

- Environmental-friendly energy town project
- Electric vehicle project
- Smart farming project
- Water resources management project, and
- Forest project
- Knowledge-based Economy;

3. Eco - Smart City Movement in Korea

3.1.2 Sustainable Seoul Smart city : Seoul e- Government

3. Eco - Smart City Movement in Korea

3.1.3 Naju Innovative City Strategy : A energy smart city

1) Objective

- Development of sustainable smart energy environment
- Establishment smart city testbed for overseas export

2) Duration, June, 2016~ May 2019

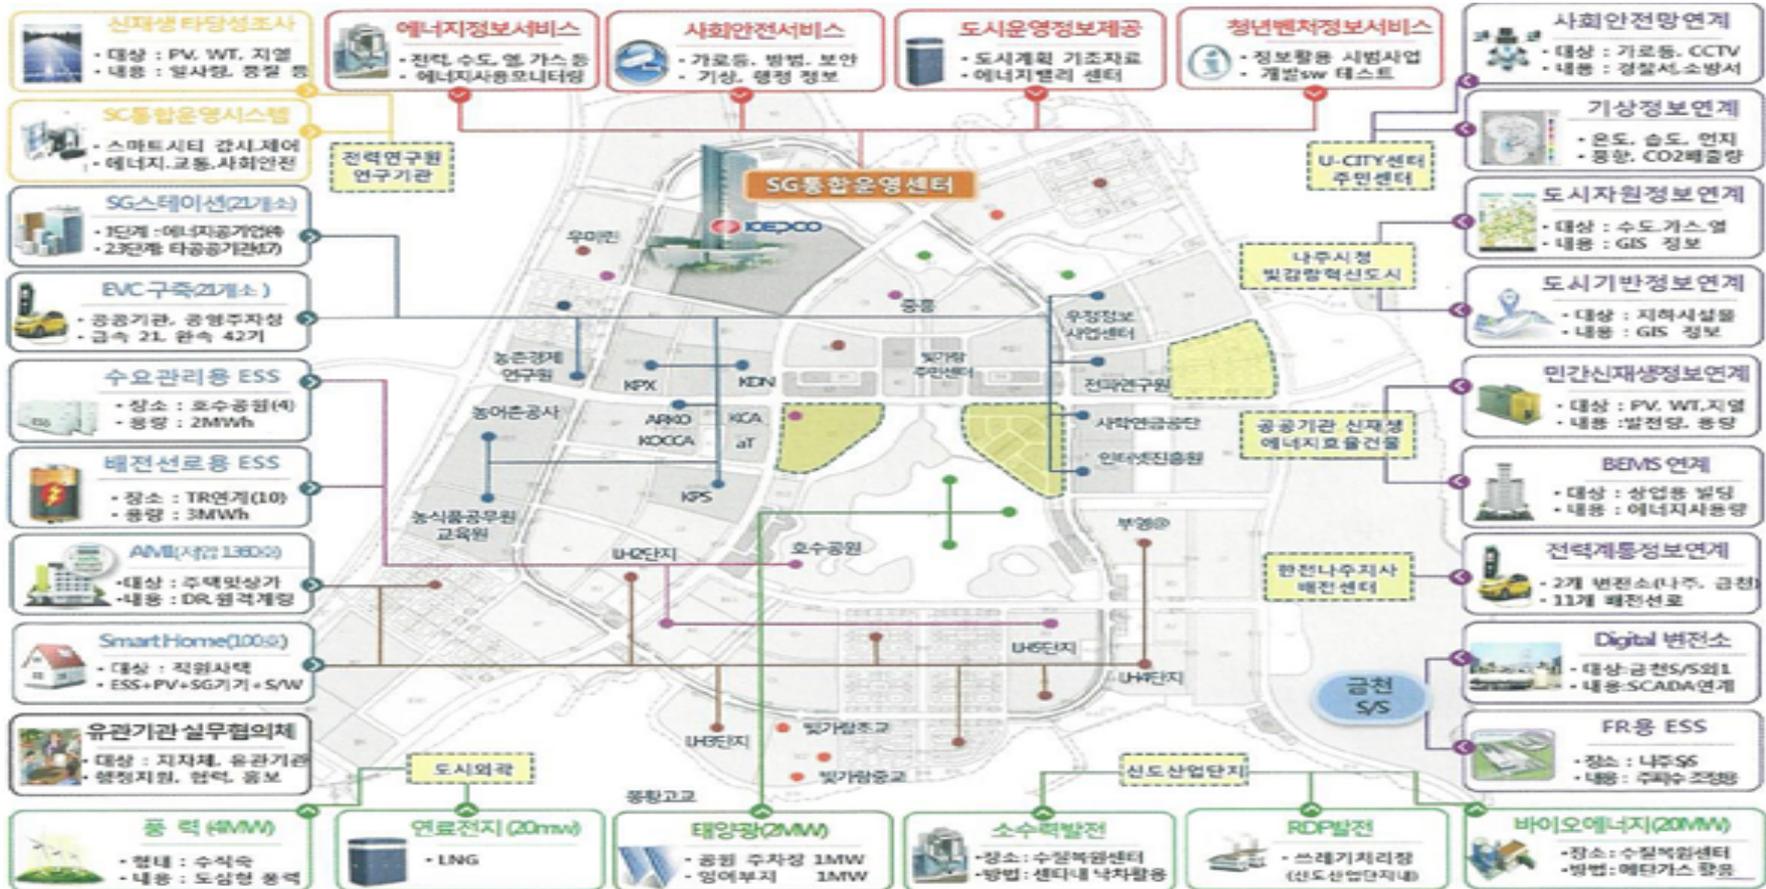

Fig. 9 Conceptual Smart Energy City

3.1.4 Wyræ Smart Green Infrastructure Strategy Planning and Implementation

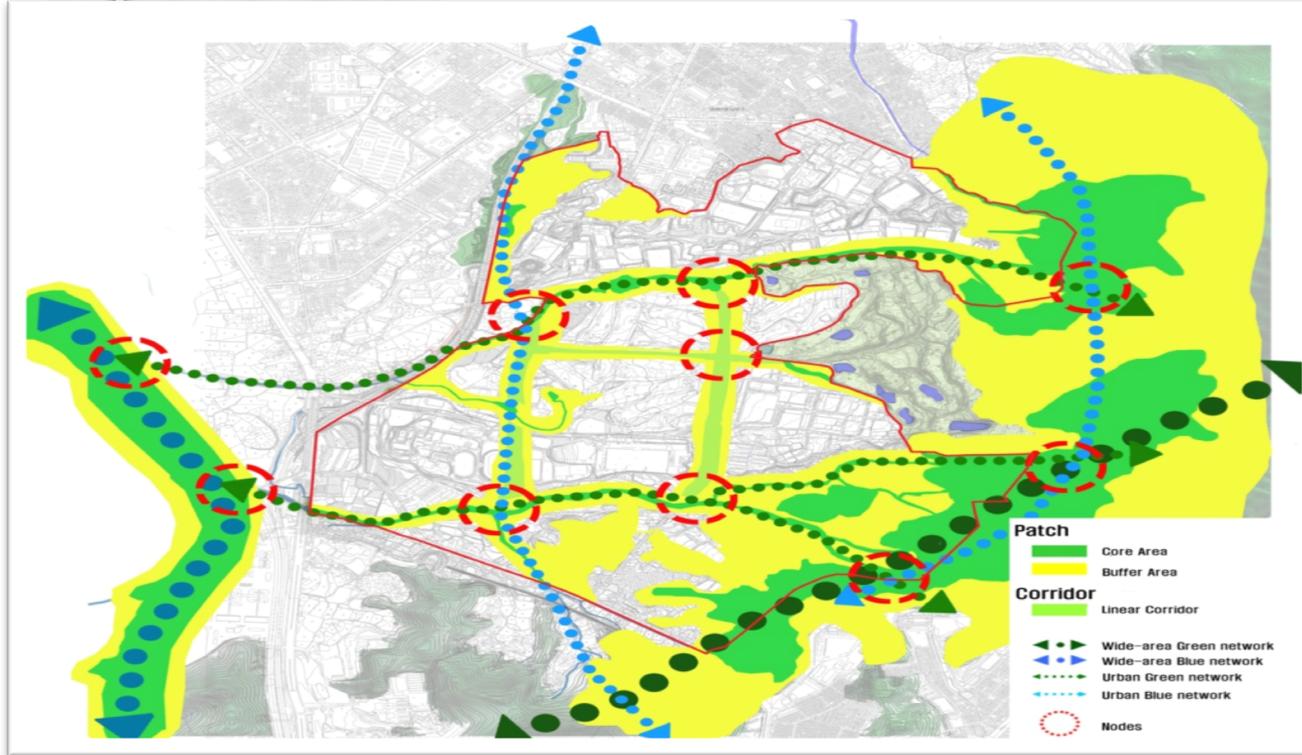

Fig. 10 Panned Components of a Green Infrastructure

3. Eco - Smart City Movement in Korea

3.2 Eco-Smart Examples at the Technical Level

3.2.1 Summary of Eco-Smart Tech

Table. 1 Strategy and projects used in the low-carbon green city projects Korea

Strategy	Project Contents
Land use	<ul style="list-style-type: none"> • Low energy structure and function of city • Compact city
Application of plan for reducing heat islands	<ul style="list-style-type: none"> • White network, blue network and planning schemes • Heat dispersion through traffic and site planning
Better efficiency in energy supply; Use of renewable energy	<ul style="list-style-type: none"> • Geothermal power, CHP • Renewable energy plants
Creation of energy consumption limits in each sector; Renovation of energy production sources	<ul style="list-style-type: none"> • Energy use standards for each size and type of building • Renovation of transportation energy fuel, Renewable energy in buildings
Creation of sustainable mobility system	Limiting automobile use in urban space Public transportation linkage system, pedestrian/bicycle oriented roads
Rainwater use; Creation of graywater reuse system; Reuse of sewage	Use of porous pavement to reduce rainwater runoff Gray water system Methane gas energy plant, Compost of sludge
Plan for urban green network, conservation and restoration of ecology	Greening plan for entire city Conservation of urban ecosystem Restoration and linkage (creation of eco-green corridor)
Reuse of solid wastes, management of business and construction waste	Wastes management from construction stage Separated recycling system Waste reuse business District heating system

4. Participatory Approaches to Eco-Smart Cities

4.1 Living Labs and ICT

4.1.1 ICT: A Prime Sector for Living Labs

Living Labs are a response to the innovation challenges related to ICT. According to the Living Labs Roadmap Work Group (2010), 70 to 95% of public and private investment in the research and development of ICT products and services does not succeed in producing a significant market value. It is estimated that one idea in 3,000 achieves the commercial stage. Living Labs thus fill the gap that exists between research and commercialization by fostering a deeper understanding of market potential and the needs of users.

Living Labs are an excellent way to support innovation in the ICT sector, by encouraging a faster cycle at a reduced cost for the development and adoption of products, services or existing technologies.

ICTs are also useful in supporting the participation and cooperation of all Living Lab collaborators by offering everyone involved the possibility of contributing, even from a distance. For example, it is possible to bring together citizens from all corners of a territory to reflect on the vision of cities in the 21st century.

The Advantages of Living Labs

The comparison of Living Labs to other research and innovation methods (testbeds, empathic design, etc.) allows us to identify the type of project that is best suited to this method of innovation.

4.1 Living Labs and IT

4.1.1 ICT: A Prime Sector for Living Labs

- **Multi-Party Collaboration**
 - ❖ Access a diverse knowledge base
 - ❖ Benefit from a research infrastructure
 - ❖ Obtain political and financial support from a community or territory
 - ❖ Create a market
 - ❖ Raise awareness among external collaborators

- **Real-life Environments**
 - ❖ Understand the “sense” that is associated with a particular product/service
 - ❖ Understand the situations and moments related to use
 - ❖ Understand the deployment of a use within a particular community. For example, in the case of a technology meant for elderly people, this approach could potentially circumvent an initial aversion to products or services.

4.1 Living Labs and IT

4.1.1 ICT: A Prime Sector for Living Labs

- **User Implication**
 - ❖ Test technological uses within particular communities
 - ❖ Invest in areas of use associated with uncertainty or particular risk factors
 - ❖ Explore and discover new needs/desires (innovation by the diversification of usage)

Living Labs are particularly pertinent in the following cases:

- ❖ Projects focussed on technologies needing adjustments or adaptations for new markets
- ❖ Projects having problems related to market adoption
- ❖ Projects centred on technologies having a specific and relatively homogenous use within a community of users
- ❖ Projects necessitating the input of users' tacit knowledge in real-life conditions
- ❖ Research and development projects for products or services where the revelation of industrial secrets is not problematic

4. Participatory Approaches to Eco-Smart Cities

4.1 Living Labs and IT

4.1.3 Seoul, City of IoT : Together with Citizens

Current Progress of Implemented Business

Progress timeline

Current Progress

1. Jongno-gu (Bukchon)

- IoT smart garbage bins
- Smart houses preventing disasters using IoT techniques
- Bukchon VR information guide

2. Cheonggyecheon Stream

- Notification service for Cheonggyecheon's history and culture based on beacons

3. City Bus Tour

- Voice service based on beacons
- Providing Seoul square information such as bus lines, famous places near bus stops, events, shopping information, etc.

4. Geumcheon-gu (Byucksan Apt.)

- Smart care service for mental health
- Management service for smart home energy
- Enter and exit system using smart phones for public entrances of apartments

5. Mapo-gu (Hongik University)

- Electronic menu service
- Information service for facilities and stores

6. Seodaemun-gu (Ewha Womans University in Sinchon)

- Face recognition door locks
- IoT home service for robbery and fire prevention
- DIY smart farming solutions based on IoT

4. Participatory Approaches to Eco-Smart Cities

Living Labs and ICT Initiative

4.2 City-zen Methodology Approach

The City-zen Roadmap Amsterdam launched in Pakhuis de Zwijger and in Dutch media (NOS, BNR) : Energy Master Plan

The City-zen Methodology Approach For Urban Energy Transitions: the energy master plan for Amsterdam, Grenoble and all other European cities.

European cities and municipalities have considerable goals in becoming carbon neutral and energy self-sufficient in line with the Paris Agreement. To be successful in reaching climate ambitions we must start now, but it is complex and easier said than done. It requires radical changes such as far-reaching energy renovations, specific approaches, new heating networks, large-scale production facilities for solar power, geothermal energy and green gas. This needs the attention and action of all stakeholders: companies, knowledge institutions, companies, housing corporations and citizens. The European research project City-zen an Urban Energy Transition Methodology is developed to draw an Energy Master Plan for a city.

The plan, a roadmap, exists of several (practical and local oriented) energy interventions and measures, both at the technical and strategic level which can be put on a timeline.

In this City-zen approach the roadmap with urban energy measures for Amsterdam and Grenoble is made in helping achieving their ambitious climate goals. With concrete examples for local neighbourhoods it explains the different scenarios that are necessary to reach ambitious climate and energy targets.

5. Lessons Learned from Korean Experiences

- ✓ Making efforts towards global mega trends
 - ✓ Adopting holistic approach of the smart city for the realization of carbonizing society
 - ✓ Initiating innovative leaderships
 - ✓ Building intelligent urban structure & Function
 - ✓ Establishing cross-industry and cross-benefits
-
- ✓ Introducing integrated technological systems
 - ✓ Analyzing value chains
 - ✓ Establishing detailed strategies and action plans
 - ✓ Bringing together citizens from all corners of a city

II. Research needs for transportation

- Development of city guides for a mobile device.**
- Techniques for connected smart car and environment-friendly green vehicle (EV, PHEV, HEV, FCEV).**
- Policy and techniques for smart highway projects.**
- Development of carbon-free transportation.**
- Creation of climate bike ride (Fig. 1).**
- Development of smart mobility (Fig. 2).**
- Development of on-line electric car (Fig. 3).**
- Smart parking (Fig. 4).**
- Impact of driverless cars.**
- Issuance of car carbon-points.**

III. Urban Mobility Future

III. Urban Mobility Future

As emerging tech creates new space innovation, we have to take a look to the transition to a more sustainable city. For example, the massive allocations of scarce urban land to parking should be avoided for the new world of safer and cleaner mobility.

We must look at how intelligent vehicle technology and iRoad will impact the design of future cities.

For example, driverless cars will enable:

- Rethinking of how our urban centers are designed and built
- Relocation of parking lots and gas stations. They will be converted into parks and green spaces.
- Reduction of single passenger use
- Reduction of curb-side parking
- Making everything electrical, point to point, pollution free
- Maintaining of freshness of data
- Sending data and reassembling data in cloud source
- Connecting of internet technology and built form
- Providing of pedestrian-only-zones with less noise, better air quality, and safer streets and roads

III. Urban Mobility Future

Here question is how government could respond to multi-layer issues for the urban mobility future of iRoad and other mobility options.

The 3rd revolution of the automotive sector includes "1st assembly line manufacturing", "2nd low-carbon technologies" and "3rd connectivity & autonomy" in order of revolution (Fig. 1). The standards to address the challenges of cyber physical environments include:

ISO 26262 "Road vehicles – Functional safety" is an international standard for functional safety of electric systems in vehicles.

General IT security standards ISO 15408, ISO 27001

SAE J3061 Cybersecurity Guidebook for Cyber-Physical Vehicle Systems

The aligned development processes for functional safety and cybersecurity of autonomous vehicles include:

Risk management and requirements management

System design based on defence-in-depth strategy

Comprehensive verification and validation

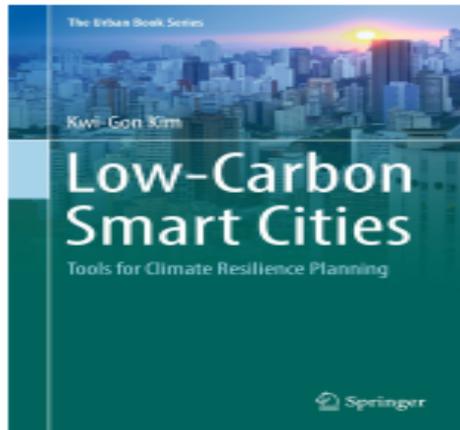

(Reeves 2016)

Low-Carbon Smart Cities

Tools for Climate Resilience Planning

Series: The Urban Book Series

- ▶ **Groundbreaking book dealing with the impact of urbanization on climate and how cities can adapt to climate change**
- ▶ **Provides innovative, practical and hands-on guidelines that can be implemented in cities around the globe**
- ▶ **Presents a variety of case studies of sustainable cities**

This book aims to integrate climate mitigation and adaptation tools into conventional urban planning. It emphasizes the value and importance of ICT as connected technology. The author believes that ICT and IOT can facilitate controlling climate change attributes when deployed with appropriate ingredients and composition in cities in an integrated comprehensive manner. It was written with the author's firm belief that cities play an important role in mitigating climate change by reducing energy consumption, promoting the use of renewable energy sources, or by trading emission permits and selling Certified Emission Rights (CERs). This book looks at green growth based on the circular economy using green smart technology as a sustainable tool for green economic development. Also for climate change adaptation, cities have to take actions to reduce the adverse impacts of climate change on people, property and ecosystems in the urban planning process.

It has been written with the author's works for Urban Environment Accords (UEA) and International Urban Training Center (IUTC) in collaboration with UNEP, World Bank, UNFCCC and UN-HABITAT. It can be used as a training source book for city climate planners and urban practitioners of local governments. It will be utilized as a more practical guidebook for climate change policy makers as well as a futuristic research agenda for next generations.
